

SPRING 1996

DEMOGRAPHICS

CALIFORNIA DEPARTMENT OF FINANCE

CRAIG L. BROWN, DIRECTOR

Message from the State Demographer

By Linda Gage

The Spring issue of California Demographics is definitely the "Data Issue." We recently completed work on two new estimates series. The July 1995 estimates, which are for counties only, include components of population change: births, deaths and migration. The January 1996 estimates include current populations for the counties and all cities. An article on population and births displays and discusses data since 1900. We are also working on an extensive analysis of the Current Population Survey data collected by the US Census Bureau. Next time there will be an article based on that research, "California at Mid-Decade." We again invite you to visit our internet site at www.dof.ca.gov for the most timely and complete demographic data.

California Population Totals 32.2 Million - January 1, 1996

California's population grew by 321,000 people in 1995 to total 32,231,000 in January of 1996 according to the Department's latest State Population Report.

The annual report reflects the use of new population estimating methods by the Demographic Research Unit, which lowers population estimates by one to two percent for the state and for most cities and counties. The new estimating method now incorporates federal tax return data. Ongoing research by the unit discovered that the tax return data were necessary to augment data on drivers licenses returned to California from other states (called "surrendered licenses"), because the number of states providing complete drivers license information to California has declined.

The new estimating method will continue to use new drivers license data from the California Department of Motor Vehicles migration report, as well as birth and death counts provided by the California Department of Health Services.

2 Historical Births in CA

By Carol Corcoran

Since 1905, when the State first tabulated births, the number of children born each year has increased nearly thirtyfold. Clearly, births have had a profound impact on the State's population. Natural population increase, or the excess of births over deaths, has resulted in nearly 12 million more Californians, or more than one in every three new residents this century.

The level of births reflect both the fertility rates and the population of women of child-bearing age. The number of women of child-bearing age has generally been on the rise since the turn of the century; however, growth has not been consistent over time. For example, when "Baby Boom"-era women entered their reproductive years, there was rapid growth in the 15-to 44-year-old population. Recently, growth of this population has slowed. Immigration of young women has not compensated for losses related to domestic migration out of the state and the aging of the "Baby Boom" population. On the other hand, the children of the first Baby Boomers are, now entering their peak child-bearing years.

Historical fertility rates have varied from a low crude birth rate (calendar-year live births divided by the total population at the midpoint of that year multiplied by 1000) of 10.6 in 1906 to a high of 24.8 in 1947, more than double the 1906 rate. Many of the most dramatic changes are clearly associated with historical events while other changes are more difficult to explain. In the years immediately following World War II families were reunited and new family formation was high. The crude birth rate rose from 19.5 to 24.8, a more than 25 percent increase. Rates remained high throughout the Baby Boom period (1946-1964), then gradually declined to a low of 14.2 in 1973, resulting in the "Baby Bust" or "Birth Dearth" period. This decline is associated with a number of societal and technological changes, for example: the entry of many women into the labor force, the availability and acceptance of birth control, increased educational attainment, and the relative cost of child rearing.

The decline in births and rates reversed in the years surrounding 1980 as rates rose to a new peak of 20.4 in 1990, and the number of births soared to 611,666. Births were more than double the 1973 level of 297,834. The population of women in the child-bearing age groups also grew significantly during this period, both as a result of the earlier Baby Boom and high levels of migration into the State. Rates rose because of immigration from countries with higher fertility and the resultant change in population composition. In addition, rates rose among the native-born population in the older child-bearing age groups, most likely the result of delayed child bearing related to rising participation in higher education and labor force participation among young women.

Since 1990, births have fallen as the population of women with the highest birth

Dolores Lykins, Coordinator

The Demographic Research Unit was established as the official State source to provide demographic data to all levels of government and to the private sector with information to aid in effective planning and policy making.

We invite readers to submit announcements of news and upcoming events, to suggest topics and respond to articles in *California Demographics*.

continued from Page 2

rates has begun to drop, and age-specific birth rates in all but the oldest cohort of child-bearing women have also declined. Women born in the smaller Baby Bust generation are aging into the peak child-bearing years while the much larger Baby Boom generation is aging out, creating what has been referred to as the "Baby Bust Echo." Declining birth rates may be more difficult to explain with any degree of certainty. California was struck by economic

recession that resulted in the loss of more than 700,000 jobs between 1990 and 1994. Domestic migration reversed a long-term net in pattern, as Californians began to leave the state for job opportunities elsewhere.

Births are expected to continue to decline slightly through the end of the decade, then to begin rising again as the population of women of child-bearing age grows.

California Population and Births

Report E-2

4

State and County Estimates—July 1995—Table One

The state's population last July is now estimated at 32,063,000. Compared to July of 1994, the state's population grew by 273,000, reflecting a natural increase of 347,108 (569,346 births less 222,238 deaths), combined with a net migration of -74,108.

POPULATION
Estimates

California Population Totals

continued from Page 1

- ▼ For the third year in a row, San Diego had the highest numerical increase in population, gaining about the same number of people (12,900) it did in the preceding year. The city's population is now estimated at 1,183,100.
- ▼ California added another city to the list of those having 100,000 or more population. With the addition of Burbank, the state now has 51 such cities. There are still 134 cities with a population of 50,000 or more, the same as last year.
- ▼ Los Angeles continues to be the state's largest city at 3,638,100. San Diego has the second largest number of residents of any city.
- ▼ There were no city incorporations last year. Of California's 470 cities, 425 gained people, three experienced no change, while the remaining 42 lost population.
